

# Intonote Cards

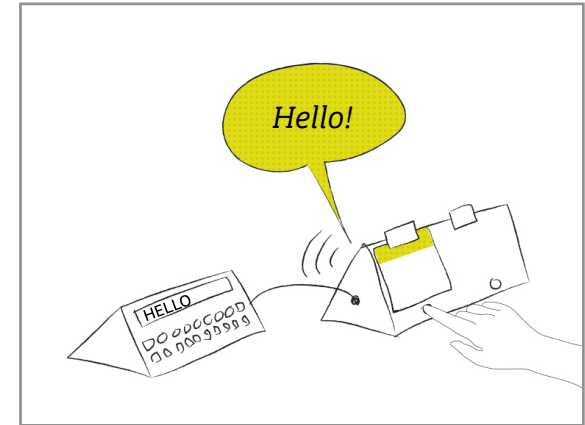

**Intonote Card** involves a product (a card 'reader') that connects to the Speech Generating Device (SGD). Intonote Cards has a collection of cards and each one represent a different tone of voice, although these are not yet described. The participant simply insert one card in the Intonote, type something in the SGD and listen to what he typed with the tone of voice of the card he chose. There are two cards slots, so that two tones can be compared.

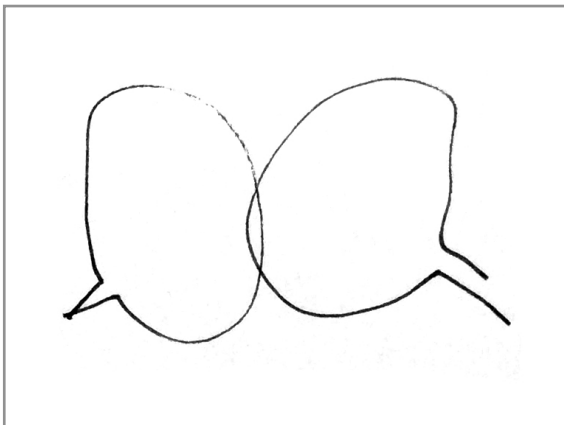

Speech and Language Therapist (SLT) explaining and welcoming the participant in the study.

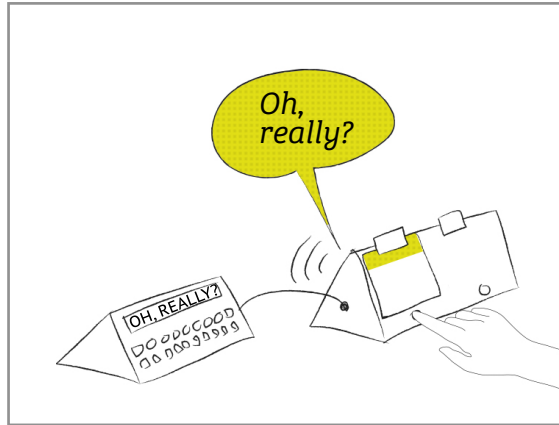

The Intonote Cards is connected to the SGD, and whatever the participant types on it, will be played with the tone of voice represented by the card in the reader.

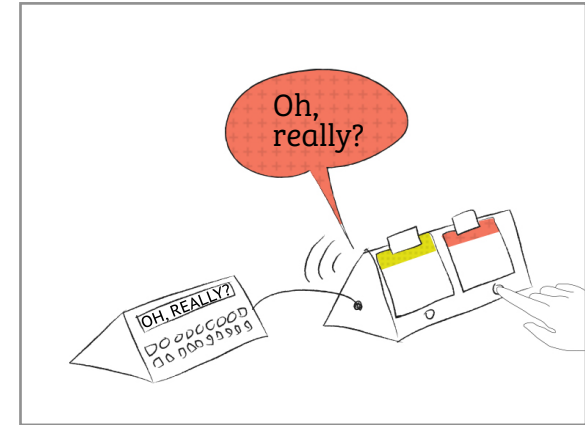

The SLT choose the first card, and ask the participant to type something and press the button under the card. They will listen to the sentence with the tone of voice that belongs to that card.

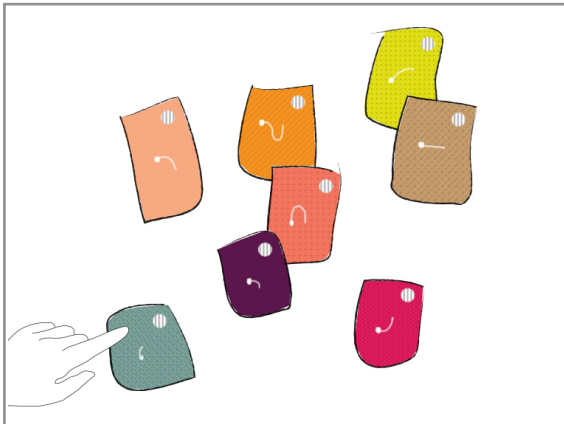

SLT and the participant discuss the first impressions from the participant about the tone of voice in his speech.

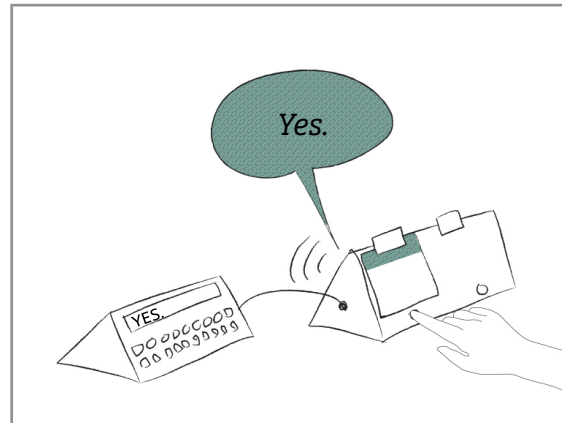

The participant type another sentence "Oh, really?" and try it with the same tone of voice.

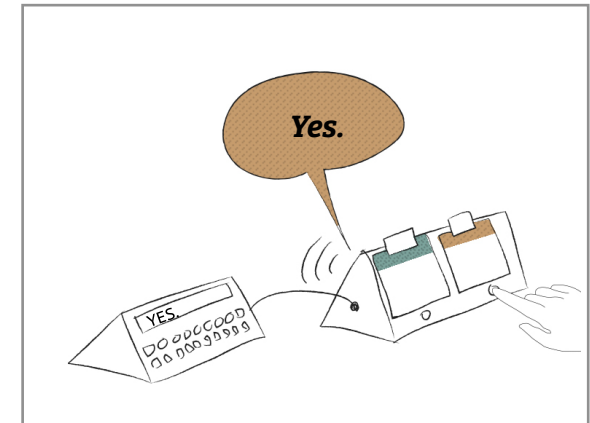

The participant try another card (different tone of voice) with the same sentence, comparing the first and the second tone to identify the differences.

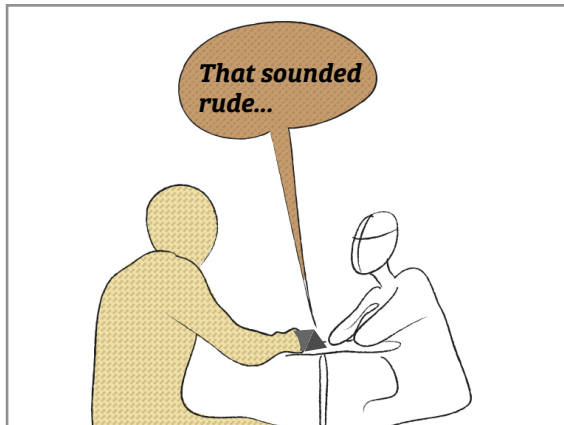

SLT and the participant choose another pair of cards.

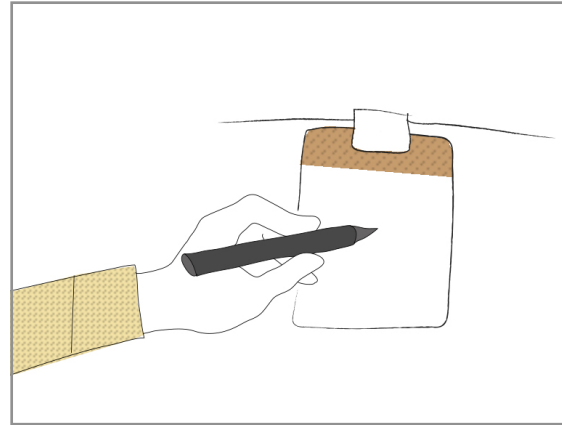

The participant now tries the word "Yes" with the new tone of voice.

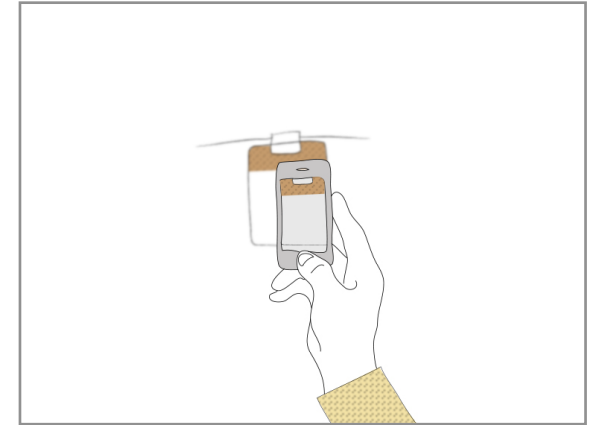

He/she compares both different tones of voice.

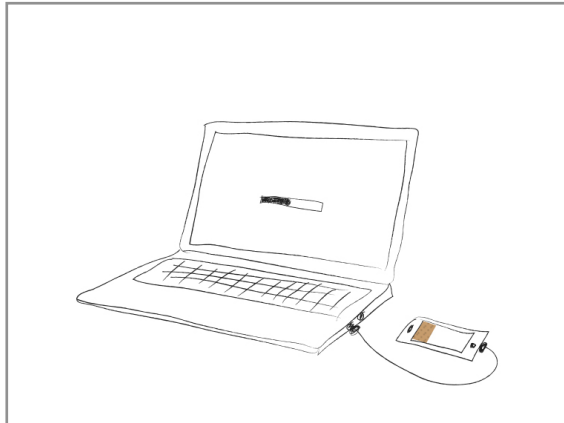

SLT and the participant discuss about the differences in those tone of voices. It's important to remember that the SGD will be plugged in the Intonote, so also their discussions would be with a tone of voice. This is important to the participant understand which contexts some tones of voice are appropriate.

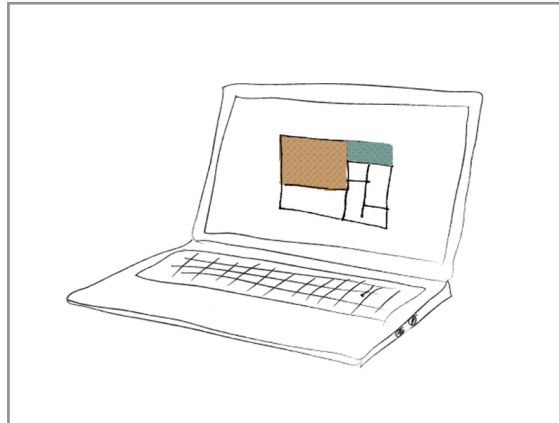

SLT will make notes about the participant's comments in the cards.

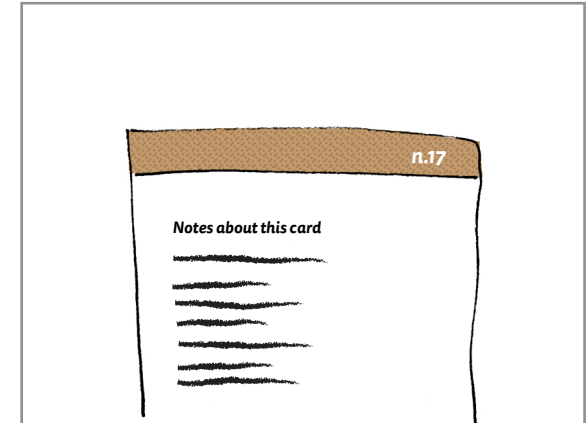

After the end of the exercise, the SLT will take a picture of the cards with the notes.

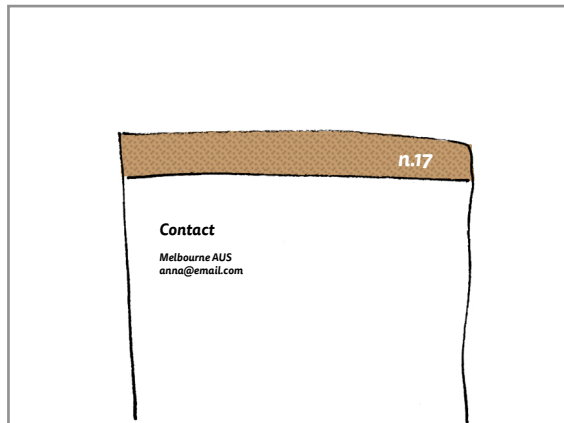

The SLT will upload the picture(s) to the Intonote website. This website will store all the cards that the researches used, building a source of information about tone of voice.

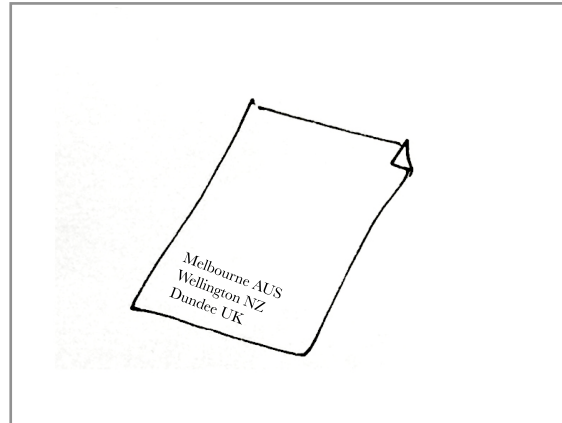

The Intonote website will also present infographics about the most used cards/tone of voice, for example. These infographics intend to bring information and trigger curiosity in others researchers worldwide.

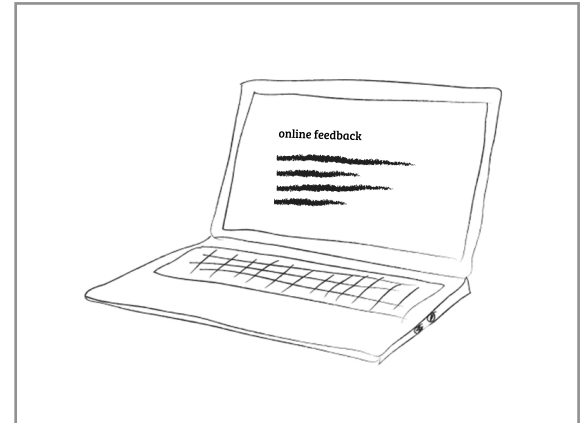

When the researcher click in some type of card, they will have informations about the tone of voice that belong to that card, how many participants liked it, which contexts the participants would use it, etc.

With this information, there will be available the contact (email) for each researcher that upload its cards, for further information.

It is expected that one of the outcomes will be more researches interested and writing papers about tone of voice, sharing their experiences with the community.

By the end of each study, the SLT will give the participant a feedback/debrief of his findings via Intonote website.
